

Interest rate forecast for PostFinance Ltd mortgages

In brief: What the latest SNB decision from 18 June 2026 means

Data valid as of: 18.6.2026 | Editorial deadline: 18.6.2026

- The Swiss National Bank (SNB) is maintaining its zero interest rate for the time being. In the medium term, however, it could return to a positive policy rate in light of the improving economic outlook and the international monetary policy environment.
- That said, Saron mortgages remain very attractive.
- Fixed-rate mortgages also offer attractive conditions thanks to low capital market interest rates.

Current economic situation in Switzerland

After a difficult second half of 2025, the Swiss economy stabilized at the start of 2026, growing by 0.7 percent in the first quarter thanks to a moderate recovery in the industrial sector. Business sentiment has also improved in recent months, underscoring these recovery trends.

However, the economy remains fragile. Swiss consumers remain extremely cautious, which is reflected in subdued consumer confidence and sluggish consumer activity. The global economic environment also remains challenging. Although a framework agreement and an opening of the Strait of Hormuz appear to be

on the horizon, a long-term solution remains uncertain. Persistently high energy prices are likely to keep inflation rates high for the time being.

Inflation has also moved slightly higher in Switzerland recently, but remains at a very low level of 0.6 percent compared to the significant rise in inflation worldwide. And, so far, the increase in energy prices has had little impact on other goods and services in Switzerland. In its monetary policy assessment, the Swiss National Bank (SNB) decided against this backdrop to leave its policy rate unchanged at zero percent for the time being.

By international comparison, Switzerland remains one of the few currency areas with moderate inflation, which is why the SNB, unlike other major central banks, is not obliged to raise interest rates. As a result, the policy rate is likely to remain unchanged in the short term. In the medium term, however, this will give the SNB the flexibility to break away from the zero interest rate mark without reducing the interest differential to the major currency areas. Moderate rises in inflation are also likely to lead to a slight rise in capital market interest rates over the coming months, which is why fixed-rate mortgage interest rates are also likely to edge up gradually.

- Interest rates moving less than 0.25%
- ↗ Interest rates rising between 0.25% and 0.49%
- ↘ Interest rates falling between 0.25% and 0.49%
- ↑ Interest rates rising 0.50% or more

How are mortgage rates developing in Switzerland?

Source: SIX, figures up to and including December 2021 based on Libor and from January 2022 on Saron.

Just over three years ago, mortgage interest rates in Switzerland were still well above the current level and briefly exceeded the 3 percent mark. This was triggered by the Swiss National Bank's (SNB) monetary policy with higher interest rates, which pushed its policy rate up to 1.75 percent due to high inflation after the coronavirus pandemic. Once inflation rates had fallen steadily again, the SNB gradually eased its monetary policy. This led to noticeably lower mortgage rates, even though they have not fallen to the same extent since the end of 2024, despite further policy rate cuts.

With the recent rise in inflation rates, major central banks worldwide are likely to adopt a more restrictive monetary policy again. This also gives the SNB leeway to move away from zero interest rates. However, we don't expect it to take this step at the next monetary policy assessment on 24 September 2026, but only in spring 2027. With mortgage interest rates, on the other hand, we expect capital market interest rates to react earlier to moderately higher inflation in Switzerland and to rise slightly accordingly. Further interest rate developments therefore remain a key factor for mortgage interest rates in Switzerland.

Fixed-rate mortgage or Saron mortgage?

Attractiveness of fixed-rate mortgages

Saron mortgages remain more attractive than fixed-rate mortgages. This is also reflected in the persistently low level of PostFinance's fixed-rate mortgage attractiveness index. Inflation rates have risen recently in Switzerland and abroad, increasing pressure on central banks to raise policy rates. However, the Swiss National Bank (SNB) remains in a comparatively comfortable position and is likely to leave its policy rate unchanged in the short term. We don't expect to see an initial interest rate hike until sometime within the next 12 months. At the same time, increased inflationary pressure is likely to lead to moderately higher long-term capital market interest rates. We therefore expect financing costs for both Saron and fixed-rate mortgages to rise slightly. The attractiveness ratio is likely to change only moderately and to remain clearly in favour of Saron mortgages.

Single-family homes and condominiums

Prices for owner-occupied apartments rose again in the first quarter of 2026, albeit less sharply than during the previous quarter. By contrast, the prices of single-family homes fell compared to the previous quarter, after having previously stagnated. The last time prices of single-family homes fell was in the fourth quarter of 2024. In addition to the currently high prices of single-family homes, which makes owner-occupied apartments a more affordable alternative for many prospective buyers, the persistently subdued consumer confidence and weaker economy are also expected to have an impact. In contrast, price dynamics are once again subdued for rental apartments. The reduction in the reference interest rate in September 2025 is increasingly being felt here. Its effects will only become visible in asking rents and existing rents with a time lag due to contractual adjustment periods.

Inflation/inflation rates: Inflation is the sustained rise in the general price level for goods and services in an economy over a particular period of time. When the price level rises, the purchasing power of money falls, i.e. fewer goods and services can be bought with the same amount of money as before.

Policy rates: Policy rates are interest rates set by central banks and are key monetary policy instruments. Policy rates determine the interest rate at which commercial banks can borrow liquidity from central banks. As a result, most short-term interest rates in an economy fluctuate with policy rates.

Capital market interest rates: Capital market interest rates have a term of over one year. They play a decisive role in the cost of long-term financing.

Reference interest rate: The mortgage reference interest rate is published quarterly by the Federal Office for Housing (FOH) and serves as the basis for rent adjustments in existing tenancies. The reference interest rate is adjusted in line with the development of the mortgage interest rate. It is based on the average mortgage interest rate offered by banks and is rounded to the nearest quarter percent.
